UVEITIS CURE

Nearly quarter of the world population carries the latent TB bacteria, mycobacterium tuberculosis, said to be inside the protective cellular walls granulomas. But that will violate the laws of thermodynamics. Any virus, fungus, bacteria including the mycobacterium tuberculosis must travel to every nook and cranny of the body since the entropy of the body continues to increase. The spreading coefficient of bacteria inside all parts of the body will be proportional to the inverse square of the immunity cells count and directly proportional to time with a constant related to each individual overall entropy. Thus

S (spreading coefficient) = E (entropy of the person) *T (time)/ N 2 (immune cells squared)

So after a finite time (from month to 10 years) any bacteria including mycobacterium tuberculosis will reach the ocular region of eyes albeit in very small number which may be less than the thresh hold of detection like less than 1 to 5 bacilli per ml. but this may be sufficient to trigger the ocular cells to full blown UVEITIS but sufficient enough for the OCULAR TB. Once UVEITIS sets in, at present only steroid is the answer to micro manage the immune overdrive of UVEITIS damage. However the same second law of the thermodynamics states that if we can remove all virus, bacteria and fungus (to reduce the overall entropy) from the body including the mycobacterium tuberculosis, then in same manner we can reverse the autoimmune UVEITIS itself by bringing the bacterial count to nearly 0.001 bacilli per ml. the same laws of thermodynamics states that the reversal time will be slightly higher that the onset time, since the overall total entropy always must increase ever so slightly. This will ensure that nearly all microorganisms in our body except gut reach a minimum number as per the laws of the thermodynamics and entropy of the body will increase only by a very small fraction from earlier time span ,since we are spending the energy of the low entropy copper to get ourselves better and better.
